Engineering Hiring Team

Tillster

Re: Senior Software Engineer – Back End

Dear Tillster Engineering Team,

I am writing to express my interest in the Senior Software Engineer – Back End role at Tillster. The opportunity to own a payment-terminal platform spanning dozens of integrations — and evolve it into a stable, pluggable SDK — is exactly the kind of architecture challenge I find compelling. While my recent production work is primarily Python, my background includes deep integration and protocol-level engineering from regulated medical devices, high-volume financial transaction systems, and modular API platform design.

Relevant experience includes:

- **Distributed systems and transaction pipelines:** At Disney I engineered Python backends processing \$10M+ in daily financial metrics at 99.99% uptime, including reconciliation automation that cut batch runtime from 8 hours to 45 minutes.
- **Integration-heavy platform design:** I have architected modular microservice platforms with versioned API contracts, external adapter patterns, and CI/CD integration testing — enabling teams to extend functionality without forking core services.
- **Low-level protocol and device integration:** Five years at Hospira verifying embedded infusion pump software — state-machine workflows, hospital network integration, formal verification, and wire-level debug alongside firmware and hardware engineers.
- **Production discipline:** OAuth2/TLS hardening, Secrets Manager credential management, CloudWatch observability, and on-call production support across AWS-hosted services.

I am based in the Los Angeles area and open to hybrid arrangements. I would welcome a conversation about how my integration and platform architecture experience translates

to Tillster's kiosk payment stack, and where Java depth would be most valuable on your team.

Thank you for your time and consideration.

Sincerely,

Cary Jones

Senior Backend Engineer
