Hiring Team

Culver City, CA

Re: Python Developer — Embedded Hardware (Long-Term Contract)

Dear Hiring Team,

I am writing to express my interest in the Python Developer role interfacing with embedded hardware in Culver City. I bring a combination that is uncommon in pure software candidates: **5 years hands-on with embedded medical device systems** at Hospira, followed by **15+ years of production Python development**. I am based in Temple City and readily commutable to Culver City for this long-term contract engagement.

My embedded systems background aligns directly with your requirements:

- **Medical device embedded experience:** At Hospira I spent five years verifying software for **Symbiq** and **Plum A+** infusion pumps — testing embedded device behavior, debugging firmware upgrades, documenting test plans, and tracking defects in a regulated FDA environment.
- **Hardware-software integration:** I collaborated closely with **firmware and hardware engineers**, supported embedded systems over wired and wireless hospital networks, and built recovery tooling to restore device software after failed firmware updates.
- **Embedded communication protocols:** I worked with **CAN bus** and embedded communication architectures, and developed host-to-device Telnet automation for verification and field-support scenarios involving hospital infusion hardware.
- **Python at scale:** Since Hospira I have delivered production Python systems — REST APIs, microservices, automated test frameworks, and AWS pipelines — with the same rigor around clean code, testing, documentation, and troubleshooting that embedded environments demand.

I am transparent that my Hospira work was verification and integration-focused rather than authoring embedded firmware — but that experience gave me deep familiarity with

how Python and host-side software must interact reliably with embedded hardware, how firmware teams think, and how to debug issues at the system boundary. I am eager to apply that foundation to building Python applications that interface directly with embedded platforms.

I would welcome the opportunity to discuss how my medical device embedded background and current Python expertise can support your team in Culver City.

Sincerely,

Cary Jones

Python Developer
